When you add a stock or other image file to a Photoshop document, that image is added to the top of the layers of the Photoshop file. This way, any image you import is accessible to the tools and features available in the Photoshop program. You can navigate to the layers of a Photoshop file in numerous ways, but the easiest way is to click the Layers icon at the bottom of the Photoshop window. For the best results, always think about the final image you want to create and start there. When you add a new image to a Photoshop document, the new image appears in the top layer of the new document. See the "Managing a document's layers" section, earlier in this chapter, for more on layers.

[Comparative study on quality control of commercial cerebral tissues of catfish between traditional and new methods]. A total of 30 samples of commercial cerebral tissues of catfish, which were collected from different producing areas in Guangdong, Guangxi, Chongqing and Shaanxi provinces, were used to detect the quality of cerebral tissues by the traditional method (Viscometry) and by the new method (MSC). The results showed that the quality of the commercial cerebral tissues was quite different among different producing areas. The new method was more sensitive and accurate than the traditional method.Spatial, temporal and frequency-dependent pharmacokinetics of nimodipine in the rat kidney: a microdialysis study. The aim of this study was to investigate the pharmacokinetic behavior of the dihydropyridine calcium channel blocker nimodipine in the renal cortex of anesthetized Sprague Dawley rats. The pharmacokinetic parameters were estimated by plotting the relationship between the mean arterial plasma concentration, $C(p)$, and the average concentration of the compound in the extracellular fluid, $C(e)$, derived from the microdialysis measurements. Our data indicated a high and fast removal of nimodipine, a moderate distribution into the tissue, and a slow, but extensive uptake from the extravascular space into the tubular cells. The removal of nimodipine was characterized by a short plasma half-life of 5 min, high tissue-to-plasma clearance, and high tissue-to-plasma distribution ratio. The uptake into the tubular cells was characterized by a slow, but extensive uptake into the tubular cell layer.Life history and stress-induced changes of immunological parameters in grasshoppers. Immunological parameters were measured in the grasshopper Abracris flavolineata collected from Bogoria District, Uganda, during different periods of life and under different stress conditions. The results demonstrated that flies were more susceptible than the adult stage of the insect. The developmental period was inversely related to the survival of the individuals. The number of circulating haemocytes was not correlated with survival, but a positive correlation was observed with the time required to reach adulthood, while a negative correlation was observed with the time required to reach maturity. Haemolymph total protein content increased from birth to maturity, while the haemocyte count decreased. Similar changes were observed when the insects were treated with 5-hydroxy-2-ketonic body

Isolation of Microvirga populi from infected apiaries. Microvirga populi was isolated from healthy and diseased adult bees taken from apiaries in Colombia and from five honey-containing bee hives with clinical signs of American foulbrood (A. mellifera scutellata x mellifera scutellata) near Atlanta, Georgia, U.S.A. A. mellifera scutellata x secutor (Buckley) from Maryland was also infected. Colony reinfection with M. populi was unsuccessful. M. populi was cultured on five different media, grown on agar slants, and purified. It is auxotrophic for hemin, menadione, and thiamine and electron microscopic examination revealed that it is in the spirillum or bacterium in the spirillum group. This is the first reported instance of isolation of M. populi from honeybee mite-

infested bees.Q: How to break out of "for" statement I have a loop: for x in range(0,len(item_dict)): for y in range(0,len(template)): print template[y] print item_dict[x] However I wanted to break out of the inner loop before it reaches the length of template. When I tried, it looks like this: for x in range(0,len(item_dict)): for y in range(0,len(template)): if x!= len(item_dict): print template[y] print item_dict[x] but it's still not working. How can I do this? A: There are at least two problems here. I'm sure it will be easier to fix the ones you find, but here are some possibilities. (1) You can't do this: for x in range(0,len(item_dict)): for y in range(0,len(
